

Products Certification

Q-LAB WEATHERING RESEARCH SERVICE

To test new exterior products, Sayerlack has chosen the **Q Lab Weathering Research Service** in Florida because the weather conditions where it operates are the most demanding for joinery coatings.

In order to assess the exterior behavior of laboratory formulations, we submitted coating samples to two different tests. Artificial accelerated aging: simulates outdoor exposure using machinery according to the EN 927-6 Regulation. Natural Aging: outdoor exposure with a 45° incline according to the EN 927-3 Regulation.

The products applied to timber were tested under extreme conditions and received certification for extremely long outdoor resistance. The results were exceptional. After the system received certification under these weather conditions, Sayerlack introduced the new and extraordinary HYDRO GOLD product line to the market. This system guarantees a 18-year life on windows and 10 years for dark coloured variants on other external surfaces.
